

MI 132: Unit 6

Part II

Radiographic Exposure Technique

RHSHS Medical Imaging Program

2022-2023

Prime Factors:

mAs
kVp

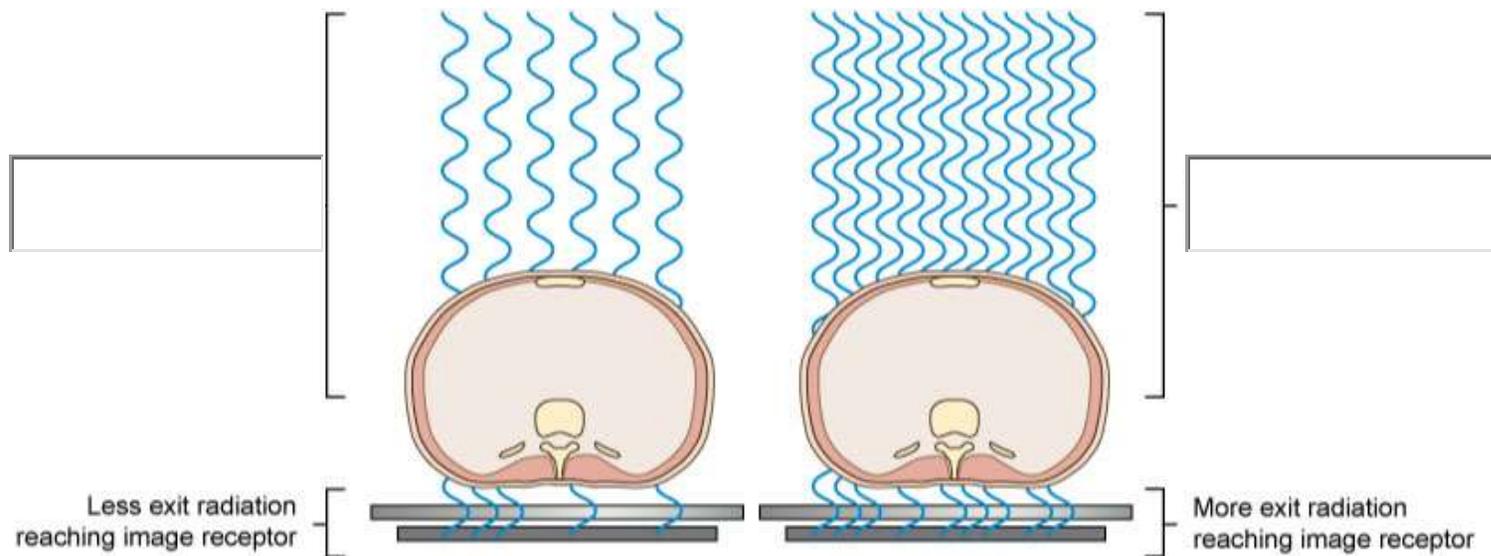

Milliamperage and Exposure Time

- Many variables can affect the amount of mAs needed to produce a diagnostic image.
 - Generator type
 - Grid usage
 - Pathology
 - Type of IR
 - SID
 - Filtration
 - Patient thickness

Milliamperage and Exposure Time

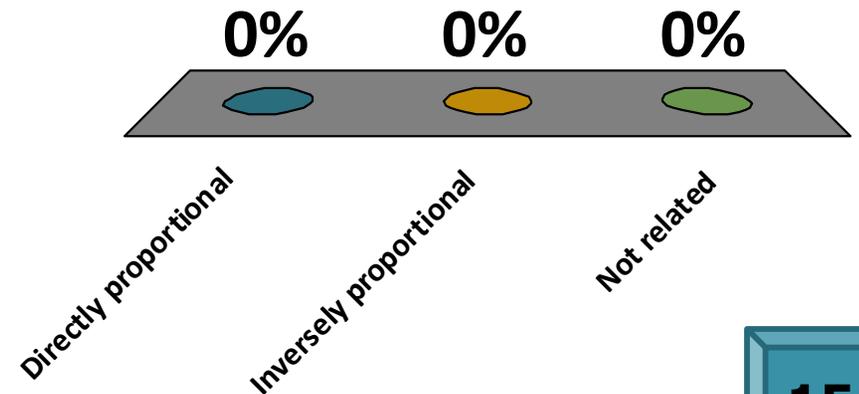

#1 - Explain the relationships between:

- a. mAs and radiation quantity
- b. mAs and patient dose
- c. mAs and receptor exposure
- d. mA and exposure time in order to maintain mAs

What type of relationship does mAs have with receptor exposure?

- A. Directly proportional
- B. Inversely proportional
- C. Not related

Calculating mAs

#2 - What formula is used to calculate mAs?

- *Complete #1 on worksheet*

Doubling/Halving mAs

- If mA and exposure time are separate functions, how could you double or halve mAs?
- *Complete #2 and #3 on worksheet*

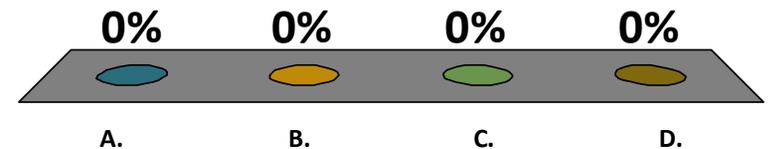

Maintaining mAs with mA and time

Reciprocity Law

- as long as mAs is the same, any combination of mA and time can be used to produce the same quantity of radiation
 - Example: 200 mA and .5 s = **100 mAs**
Double exposure time and halve mA ...
 - 100 mA and 1s = **100 mAs**
Double mA and halve time...
 - 400 mA and .25 s = **100 mAs**
 - Example:
 - 300 mA and .5 s = 150 mAs
 - 400 mA and .375 s = 150 mAs
 - 600 mA and .25 s = 150 mAs
- *Complete #4-#6 on Worksheet*

Which of the following will produce the greatest receptor exposure?

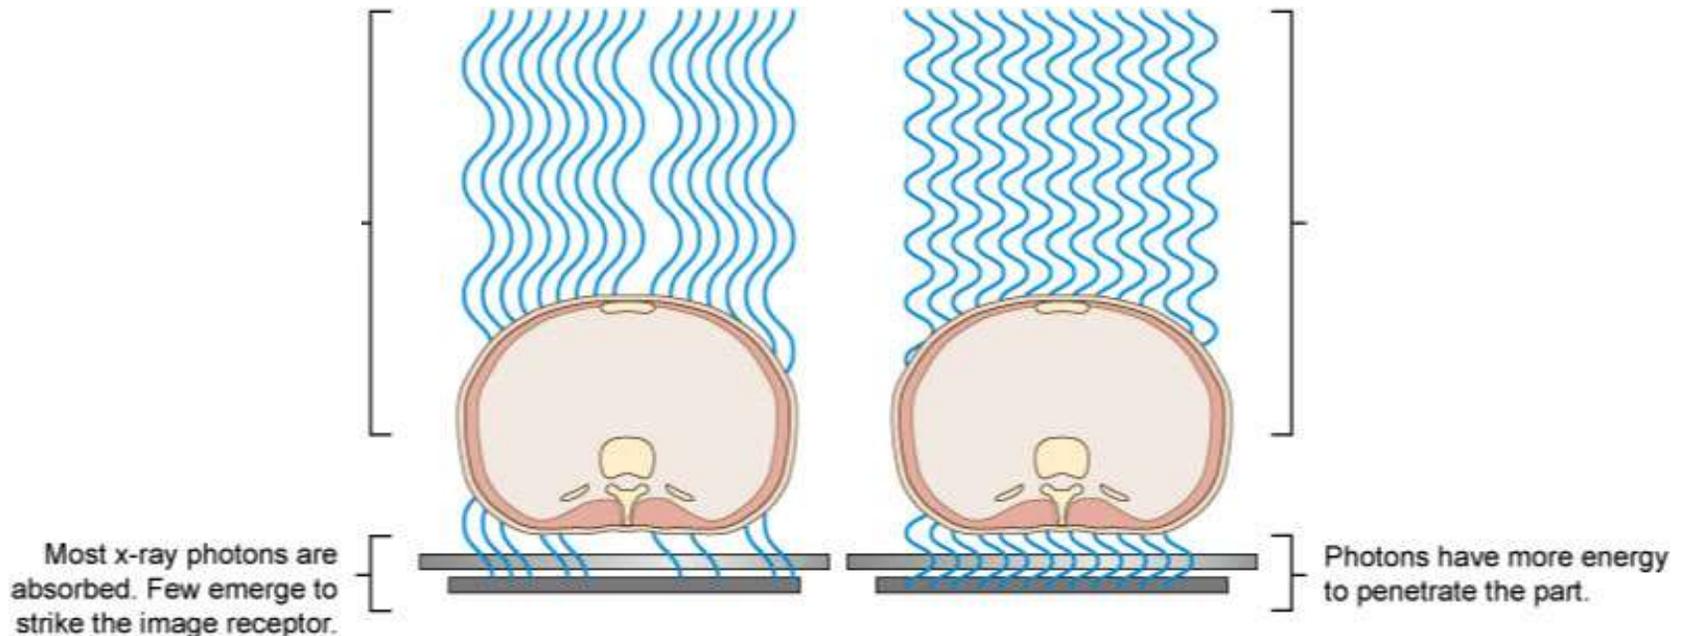

- A. 100 mA, 20 ms
- B. 200 mA, 40 ms
- ✓ C. 400 mA, 50 ms
- D. 600 mA, 30 ms

Kilovoltage-peak (kVp)

#3 - Explain the relationship between:

- a. kVp and radiation quantity
- b. kVp and radiation quality
- c. kVp and patient dose
- d. kVp and receptor exposure

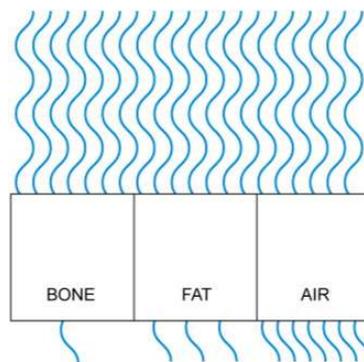

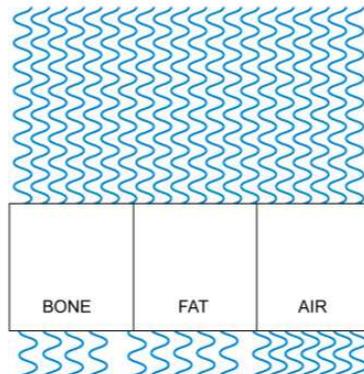

kVp and Subject Contrast

- #4 - Explain how a higher kVp affects:
- a. Penetrating power of the beam
 - b. Absorption
 - c. Transmission
 - d. Differential absorption
 - e. Subject contrast

kVp and Subject Contrast

Determining kVp Values

Minimum vs Optimum kVp

- **Minimum kVp** – lowest kVp that still provides some degree of penetration through ALL tissues of interest
- **Optimum kVp** – the level of kVp well above the minimum required for sufficient penetration
 - Strikes appropriate balance between reducing patient dose and preventing excessive scatter

<u>Procedure</u>	<u>Minimum kVp for Sufficient Penetration</u>	<u>Recommended Optimal kVp for Digital Imaging</u>
Hand/Wrist/Digits	54	64
Elbow/Forearm/Foot	62	72
Ankle/Leg	66	76
Knee/Humerus	70	80
Mandible	70	76
Femur/Shoulder/Sinus/Ribs	76	86
Cervical/Thoracic Spines	76	86
Iodine Procedures (IVU)	76	80
Abd/Pelvis/Lumbar Spines	80	90
Non-Grid Chest	80	86
Skull	80	90
Air Contrast Ba Studies	92	100
Esophagram	92	92
Solid Ba Studies	110	120
Grid Chest (fixed unit)	120	120

Quinn B. Carroll; Radiography in the Digital Age

kVp and Technique Manipulation

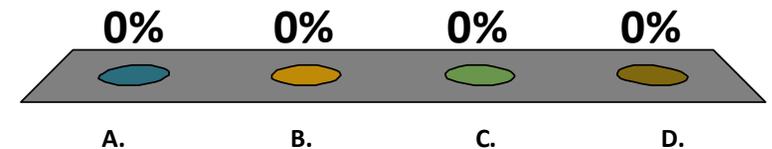

#5 - How does kVp need to be adjusted in order to:

- double receptor exposure?
- halve receptor exposure?

If you increase kVp by 15%, then receptor exposure:

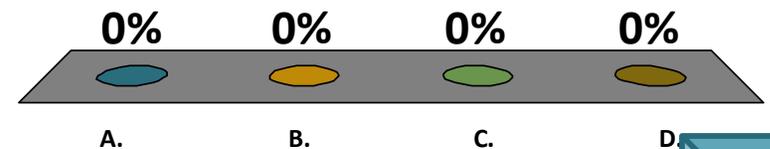

- A. Increases by 15%
- B. Increases by 30%
- ✓ C. Doubles
- D. Will decrease

Exposure factors of 8 mAs and 80 kVp were used.
Which of the following changes would result in twice the exposure to the IR?

- A. 4 mAs
- ★ B. 16 mAs
- C. 160 kVp
- D. 68 kVp

kVp and Maintaining IR Exposure

#6 - To maintain receptor exposure, how does mAs need to be adjusted if kVp is increased from 70 kVp to 80 kVp?

#7 - To maintain receptor exposure, how does mAs need to be adjusted if kVp is decreased from 70 kVp to 60 kVp?

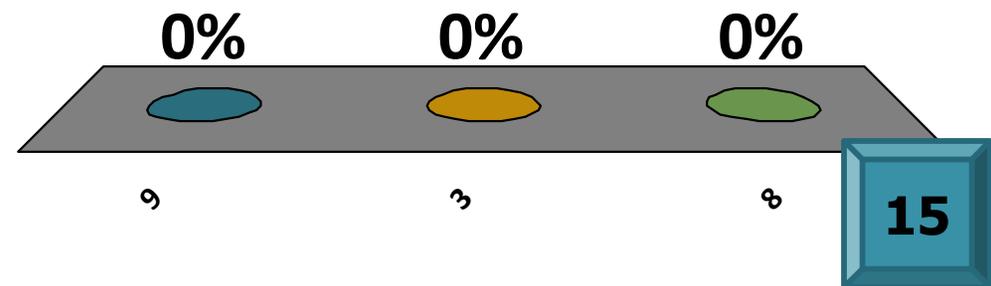

****Complete #9 - #13 on worksheet**

If you use 6 mAs with 50 kVp and then change to 58 kVp...what mAs will you need to maintain the original exposure (EI)?

A. 9

✓ B. 3

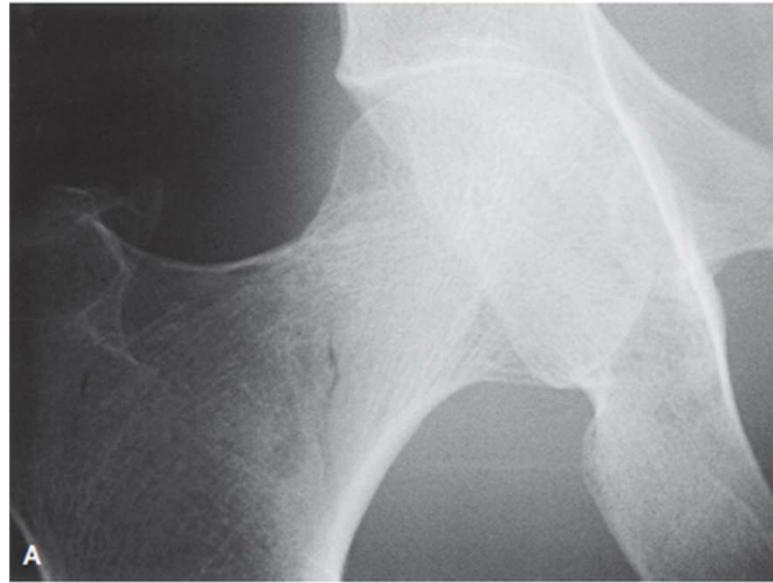

C. 8

Technique Error Effects on Image Appearance

#8 - What is the consequence of too low of a technique (mAs/kVp) on image quality?

Technique Effects on Image Appearance

#9 - What is the consequence of too high of a technique (mAs/kVp) on image quality?

mAs and Repeat Images

#10 - If an image needs repeated due to exposure errors, what is the typical change to mAs required to correct the error?

- *Complete #14 on worksheet*

kVp and Repeat Images

- *Contrast errors*
- *Scatter*
- *Radiation Protection*

kVp and Scatter

mAs and kVp

	Receptor Exposure	Spatial Resolution	Distortion
mAs	<input type="text"/>	<input type="text"/>	<input type="text"/>
kVp	<input type="text"/>	<input type="text"/>	<input type="text"/>
Focal Spot Size			
SID			
OID			
Grid			
Tube filtration			
Beam restriction			
Motion			
Patient factors (size, pathology)			
Angle (tube, part, receptor)			

Secondary Factors

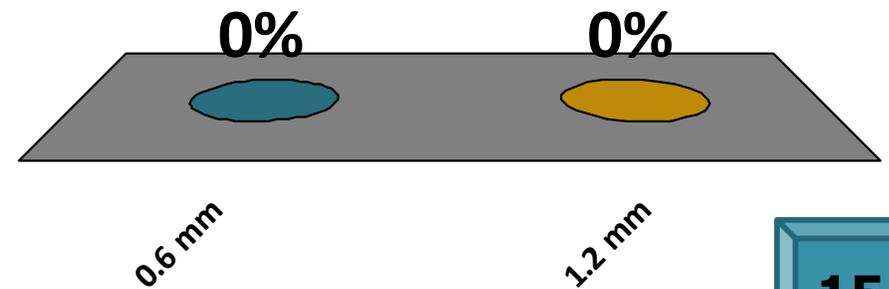

- **Focal spot size**
- **Source-to-image receptor distance (SID)**
- **Object-to-image receptor distance (OID)**
- **Central ray–anatomic part–image receptor alignment**
- **Grids**
- **Beam restriction**
- Generator output
- **Tube filtration**
- Compensating filters
- Type of IR
- **Patient factors**

Focal Spot Size

	Receptor Exposure	Spatial Resolution	Distortion
Focal Spot Size	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
SID	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
OID	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Grid			
Tube filtration			
Beam restriction			
Motion			
Patient factors (size, pathology)			
Angle (tube, part, receptor)			

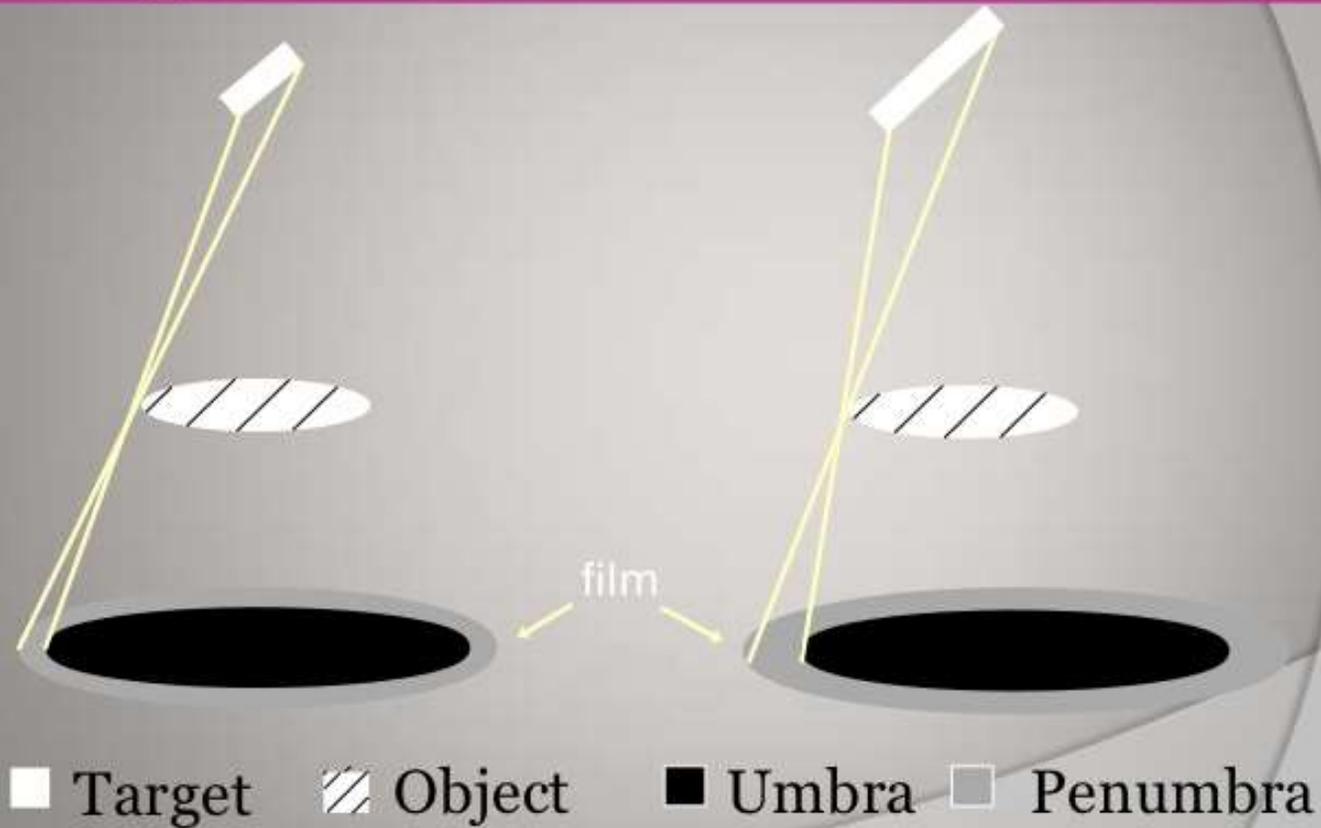

Which focal spot size would give the best spatial resolution?

- ★ A. 0.6 mm
- B. 1.2 mm

Focal Spot Size

Decrease focal spot size, increase sharpness

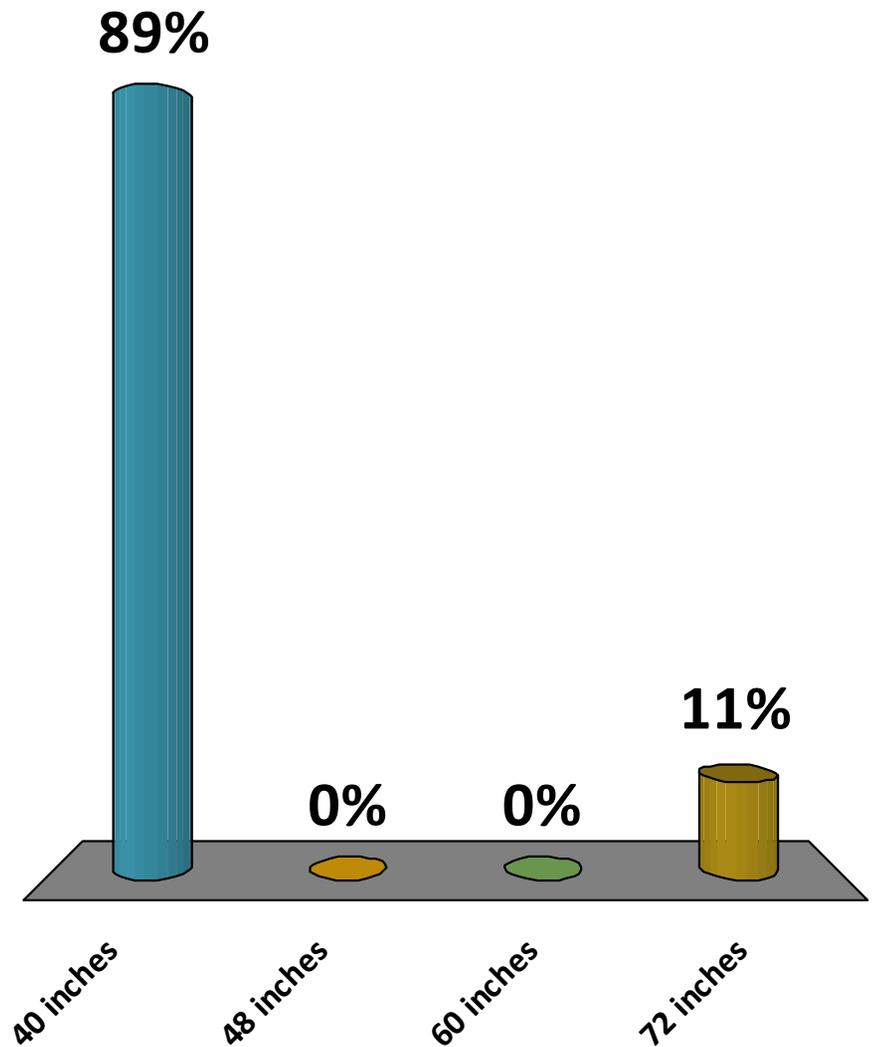

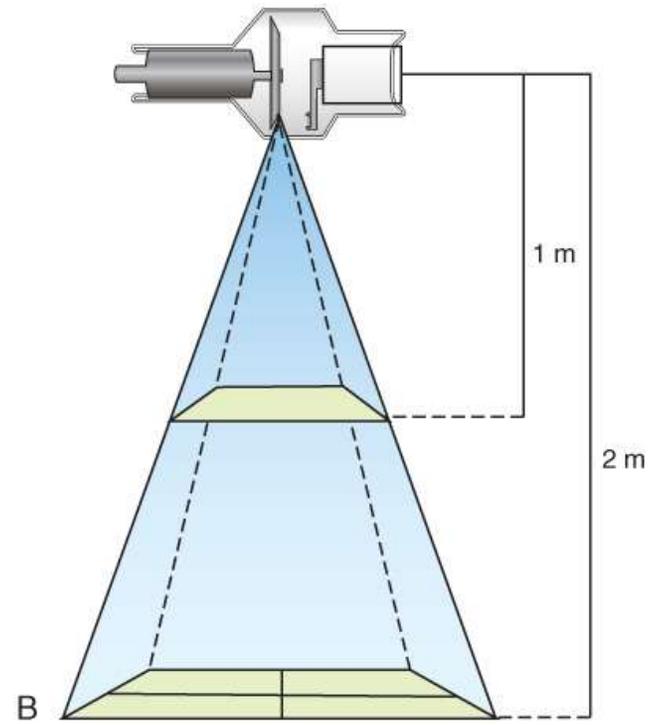

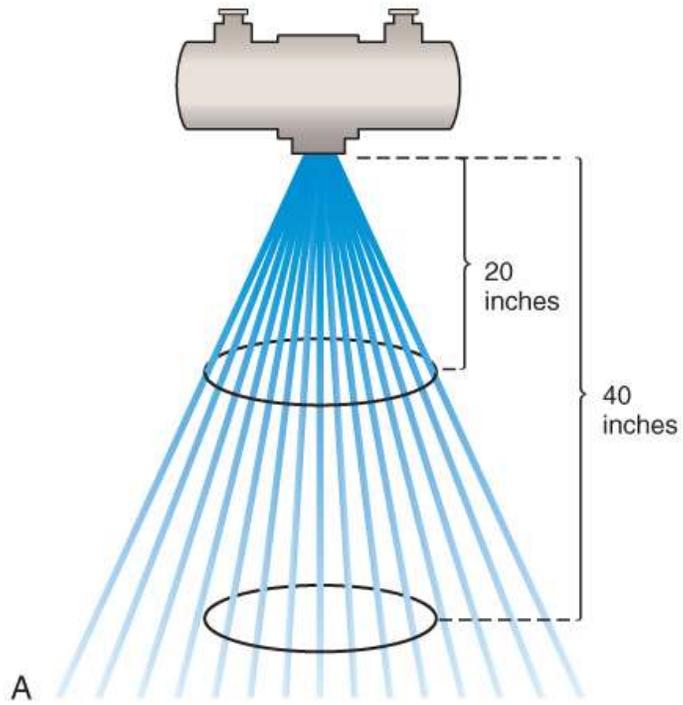

Source-to-Image Receptor Distance (SID)

	Receptor Exposure	Spatial Resolution	Distortion
Focal Spot Size	<input type="text"/>	<input type="text" value="x"/>	<input type="text"/>
SID	<input type="text" value="x"/>	<input type="text" value="x"/>	<input type="text" value="size"/>
OID	<input type="text"/>	<input type="text"/>	<input type="text"/>
Grid			
Tube filtration			
Beam restriction			
Motion			
Patient factors (size, pathology)			
Angle (tube, part, receptor)			

Which of the following SID's would produce the **highest** receptor exposure?

- ★ A. 40 inches
- B. 48 inches
- C. 60 inches
- D. 72 inches

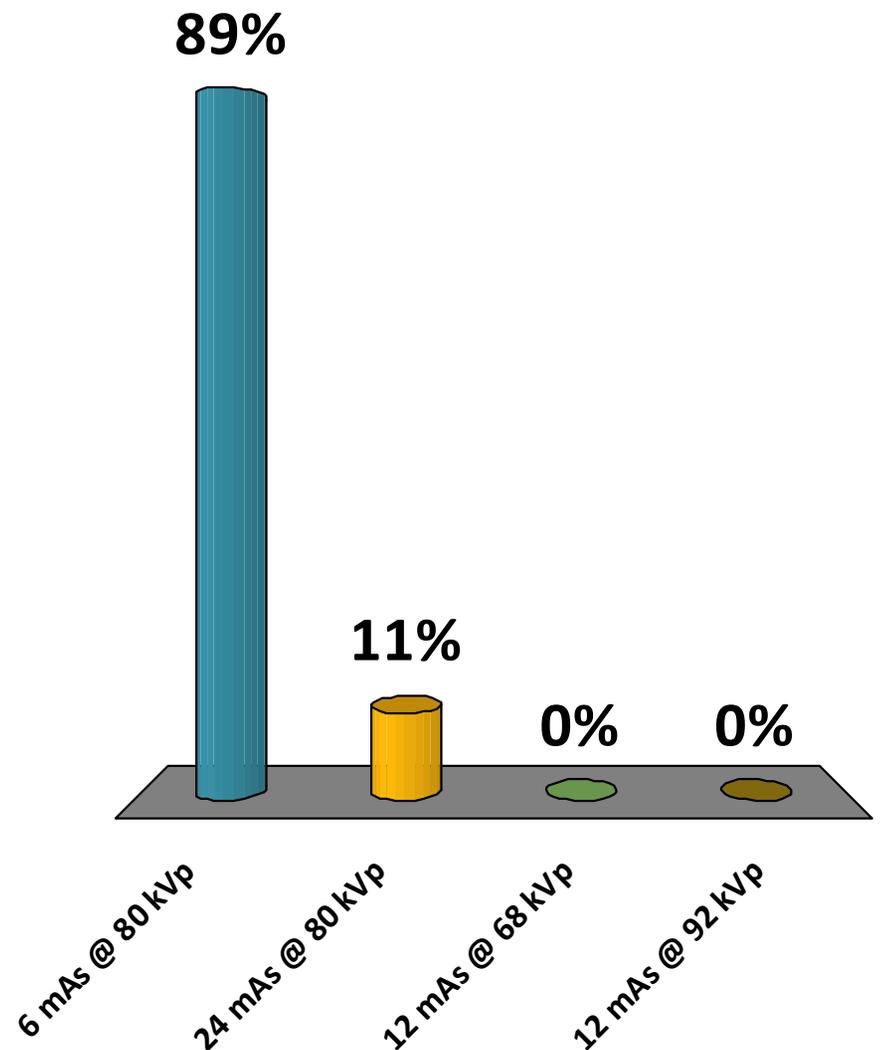

SID and Technique Manipulation

#2 - If SID is greater/lesser than what is required, what formula is used in order to maintain appropriate receptor exposure?

**Complete #15 and #16 on worksheet*

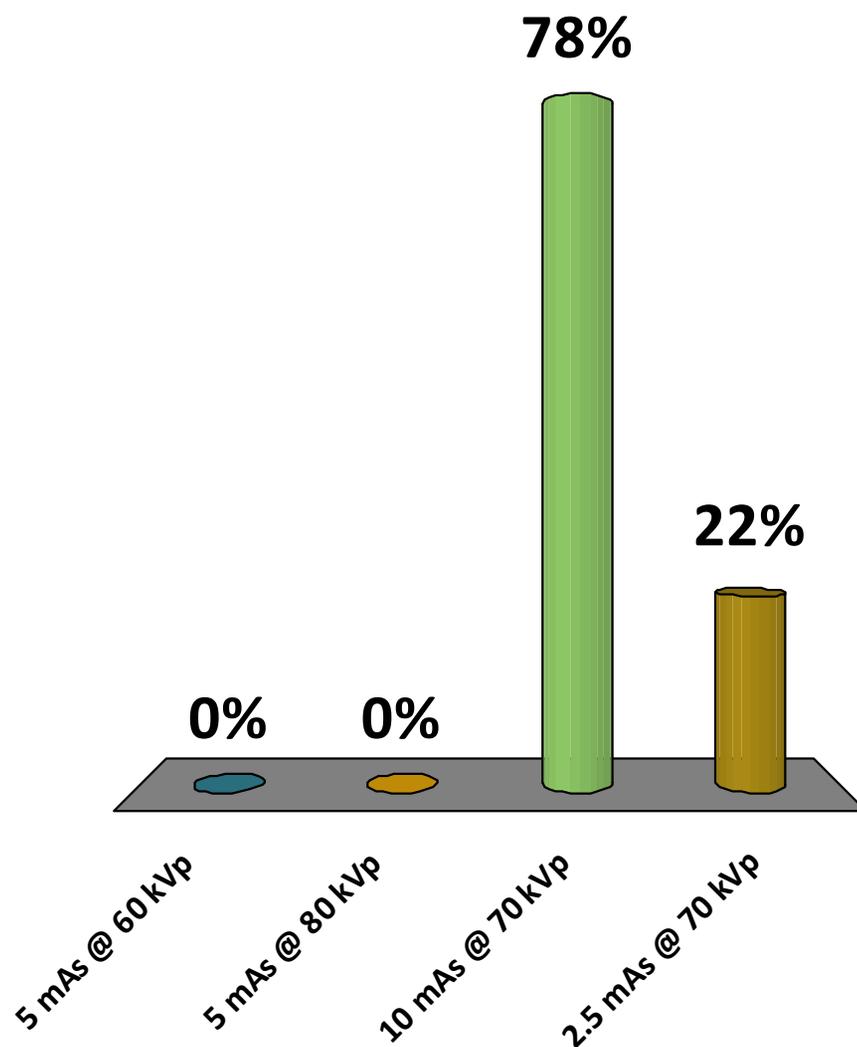

Technique in book is for 72 inch SID, 12 mAs @ 80 kVp. SID obtained is 56 inches. How should technique be adjusted to maintain exposure to IR?

- ★ A. 6 mAs @ 80 kVp
- B. 24 mAs @ 80 kVp
- C. 12 mAs @ 68 kVp
- D. 12 mAs @ 92 kVp

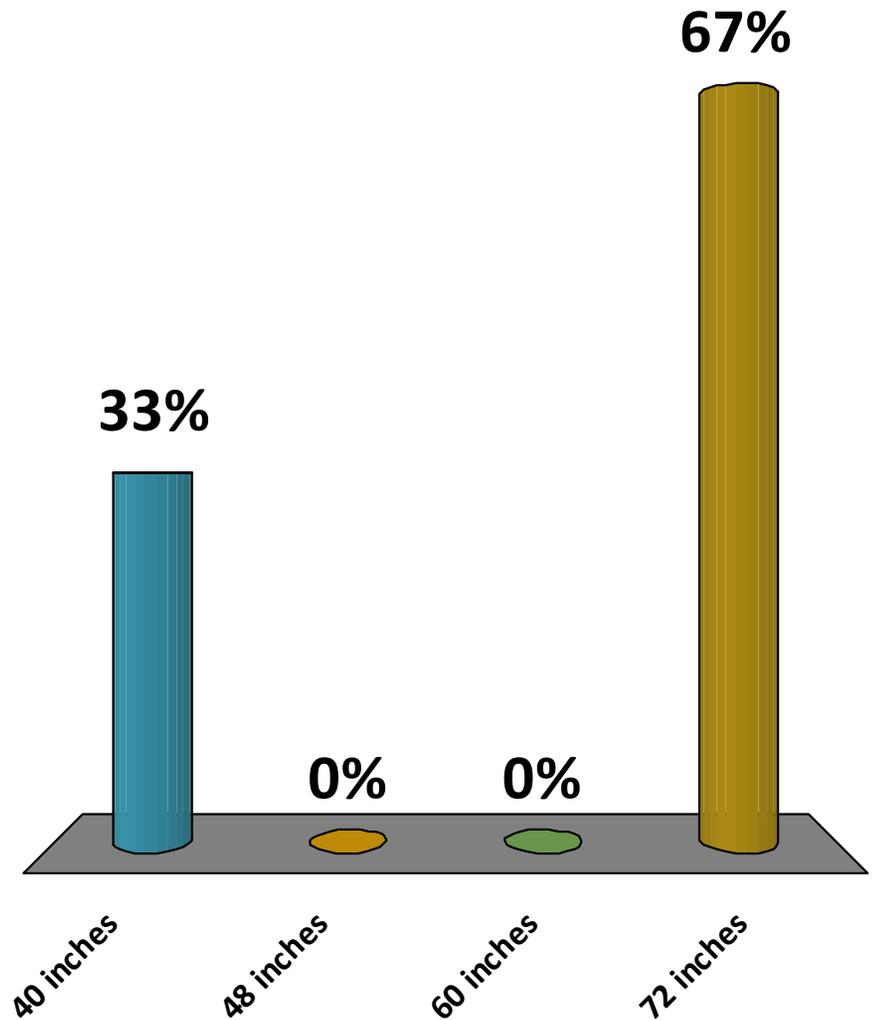

Technique in book is for 40 inch SID, 5 mAs @ 70 kVp. SID obtained is 56 inches. How should technique be adjusted to maintain exposure to IR?

- A. 5 mAs @ 60 kVp
- B. 5 mAs @ 80 kVp
- ★ C. 10 mAs @ 70 kVp
- D. 2.5 mAs @ 70 kVp

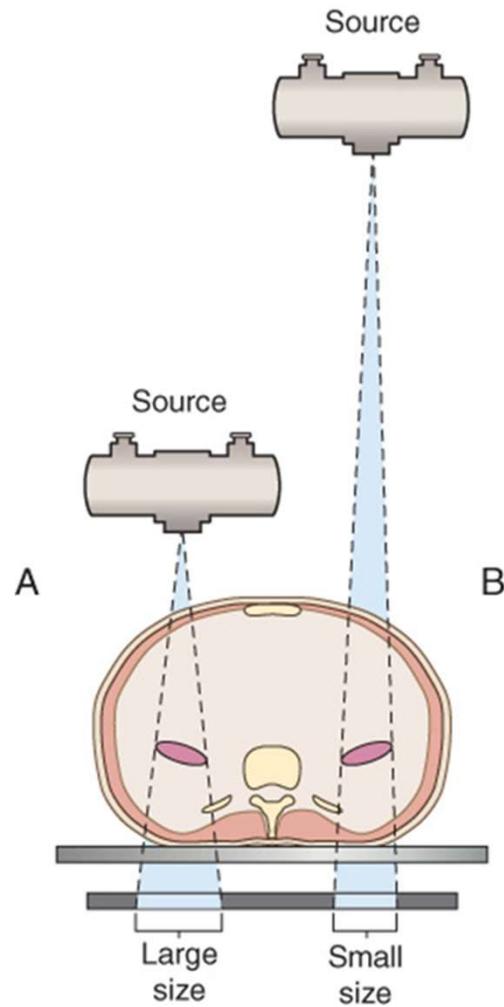

Which of the following SID's would produce the least amount of distortion?

- A. 40 inches
- B. 48 inches
- C. 60 inches
- ★ D. 72 inches

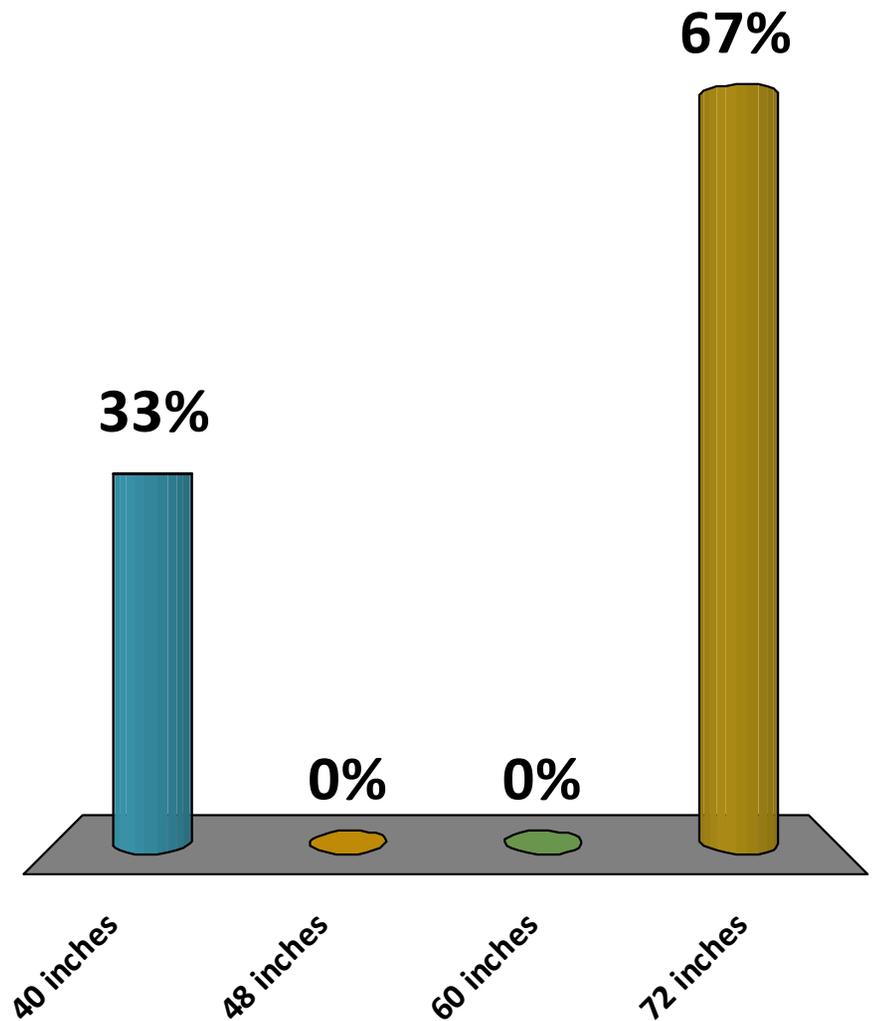

SID and Size Distortion

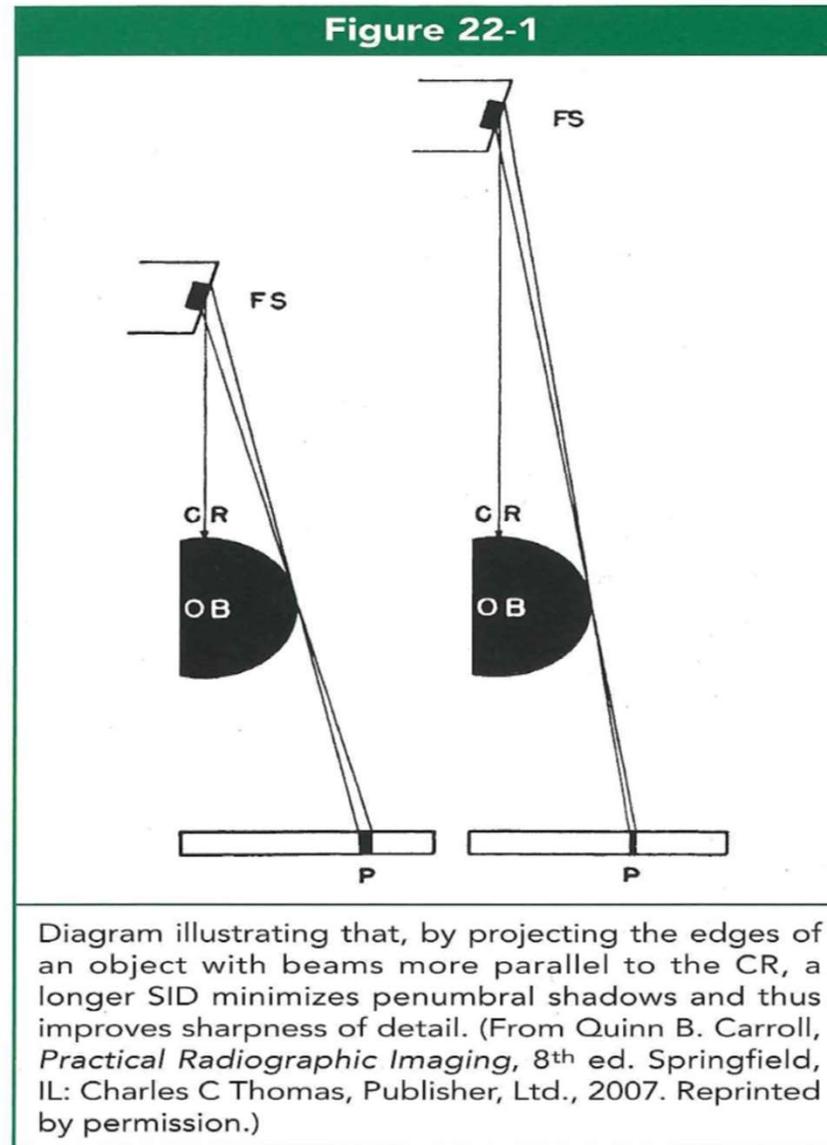

Which of the following SID's would result in the best spatial resolution?

- A. 40 inches
- B. 48 inches
- C. 60 inches
- ★ D. 72 inches

SID and Spatial Resolution

SID

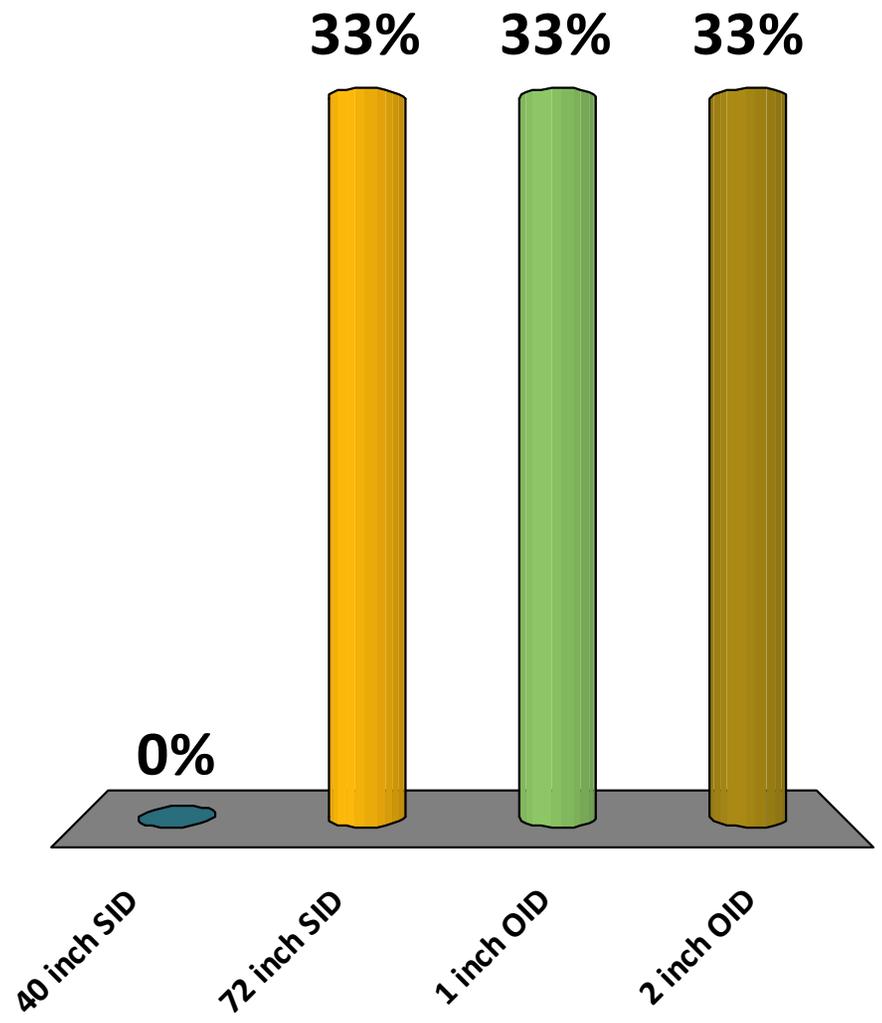

- To summarize:
 - Increased SID:
 - Less size distortion (Mag)
 - Better spatial resolution (Sharpness)
 - Minimized (decreased) unsharpness
 - Less receptor exposure

Object-to-Image Receptor Distance (OID)

	Receptor Exposure	Spatial Resolution	Distortion
Focal Spot Size	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
SID	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/> Size
OID	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/> size
Grid			
Tube filtration			
Beam restriction			
Motion			
Patient factors (size, pathology)			
Angle (tube, part, receptor)			

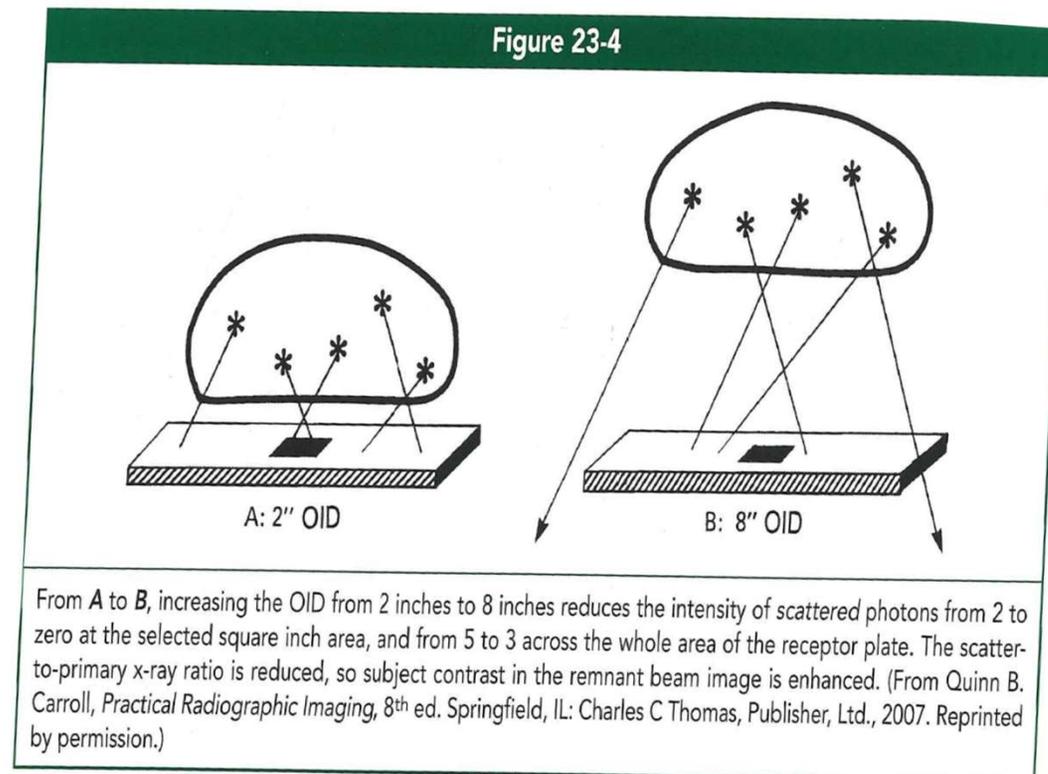

Which of the following would result in the **least** amount of scatter radiation reaching the IR?

- A. 40 inch SID
- B. 72 inch SID
- C. 1 inch OID
- ★ D. 2 inch OID

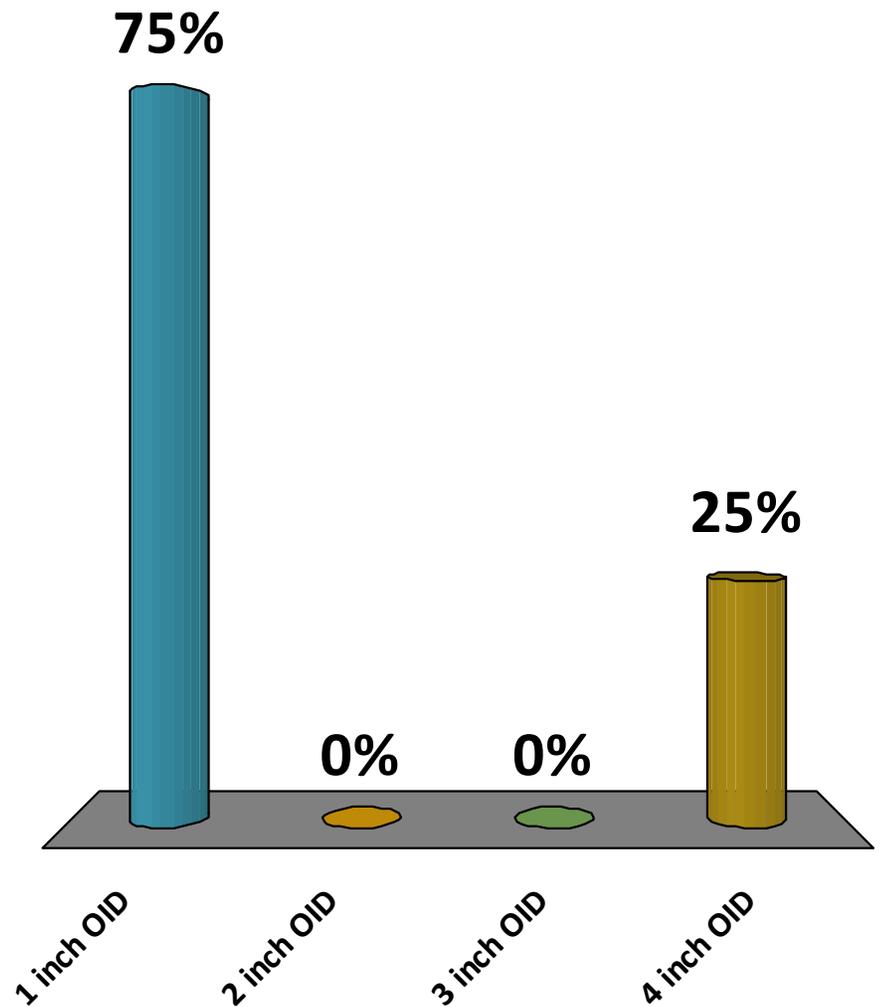

OID, Receptor Exposure, and Scatter

#4 - How does an increased OID effect radiographic contrast?

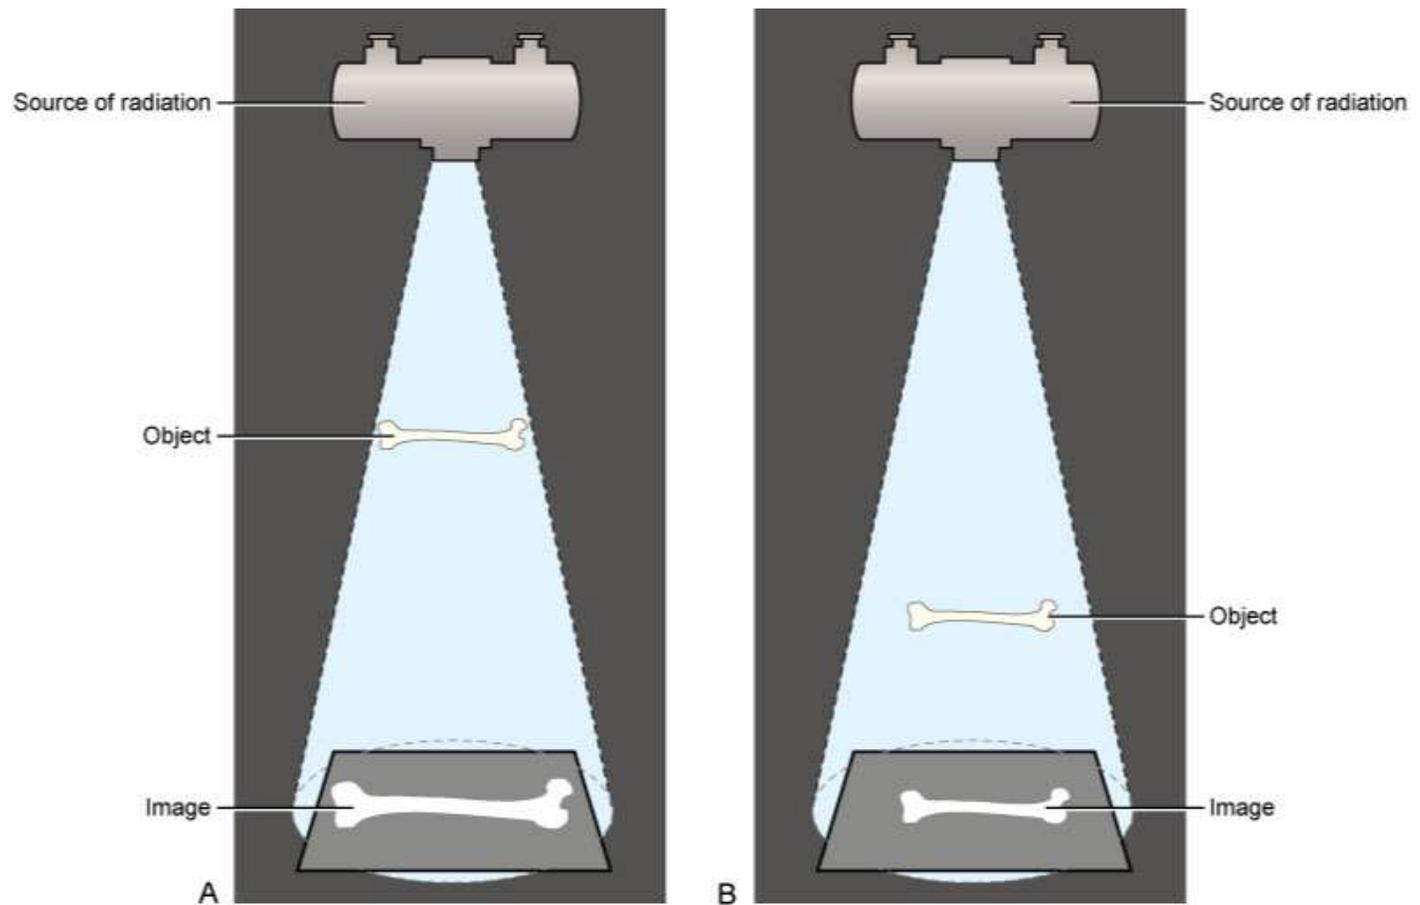

Which of the following would result in the **least** amount of distortion?

- ★ A. 1 inch OID
- B. 2 inch OID
- C. 3 inch OID
- D. 4 inch OID

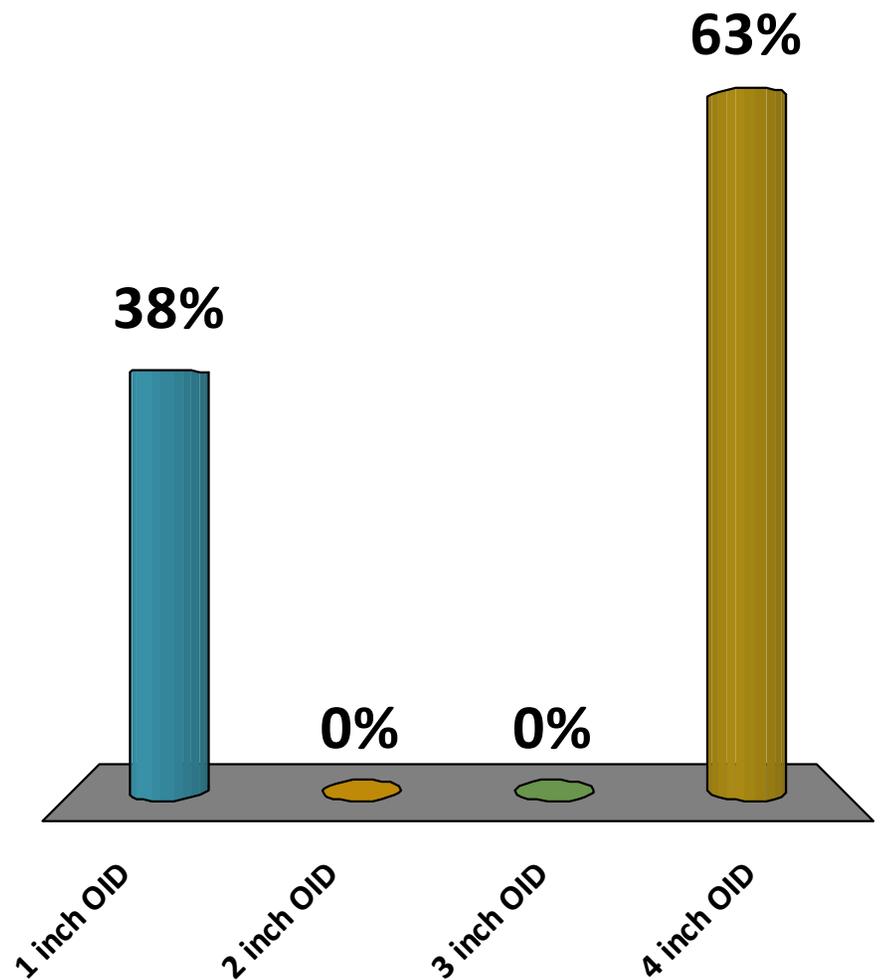

OID and Magnification

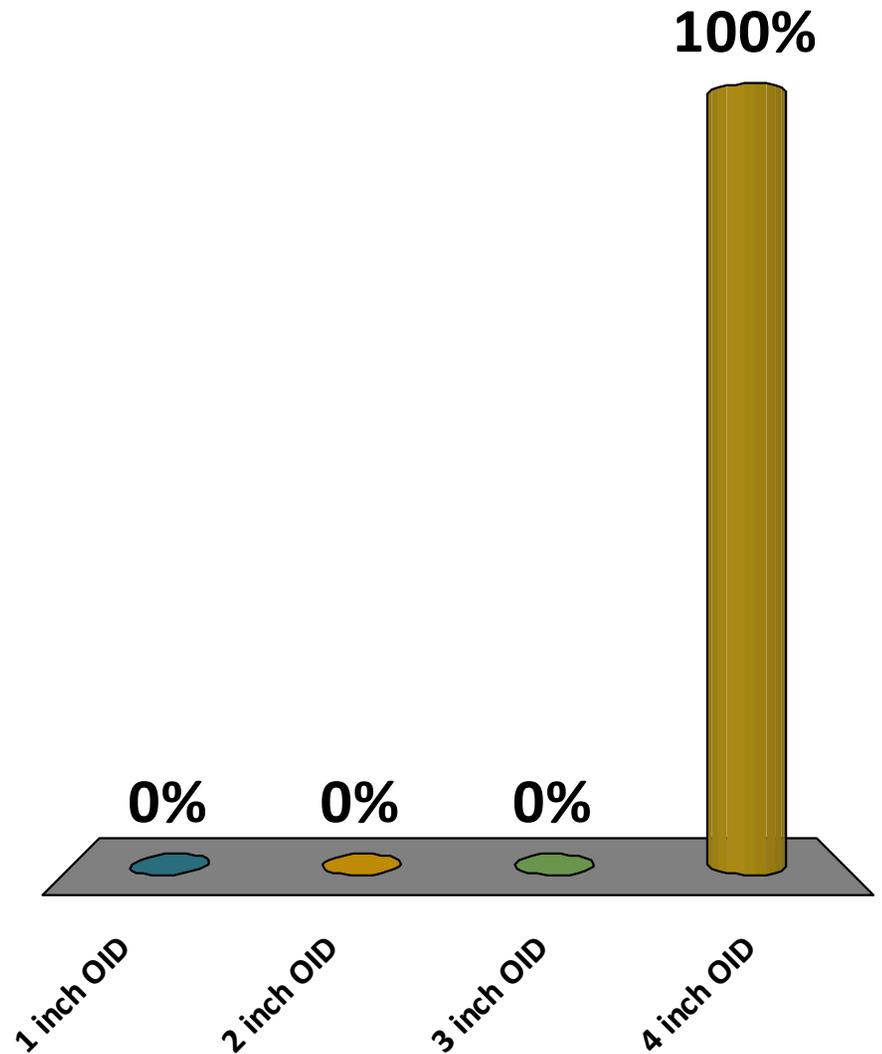

Which of the following would result in the **best** spatial resolution?

- ★ A. 1 inch OID
- B. 2 inch OID
- C. 3 inch OID
- D. 4 inch OID

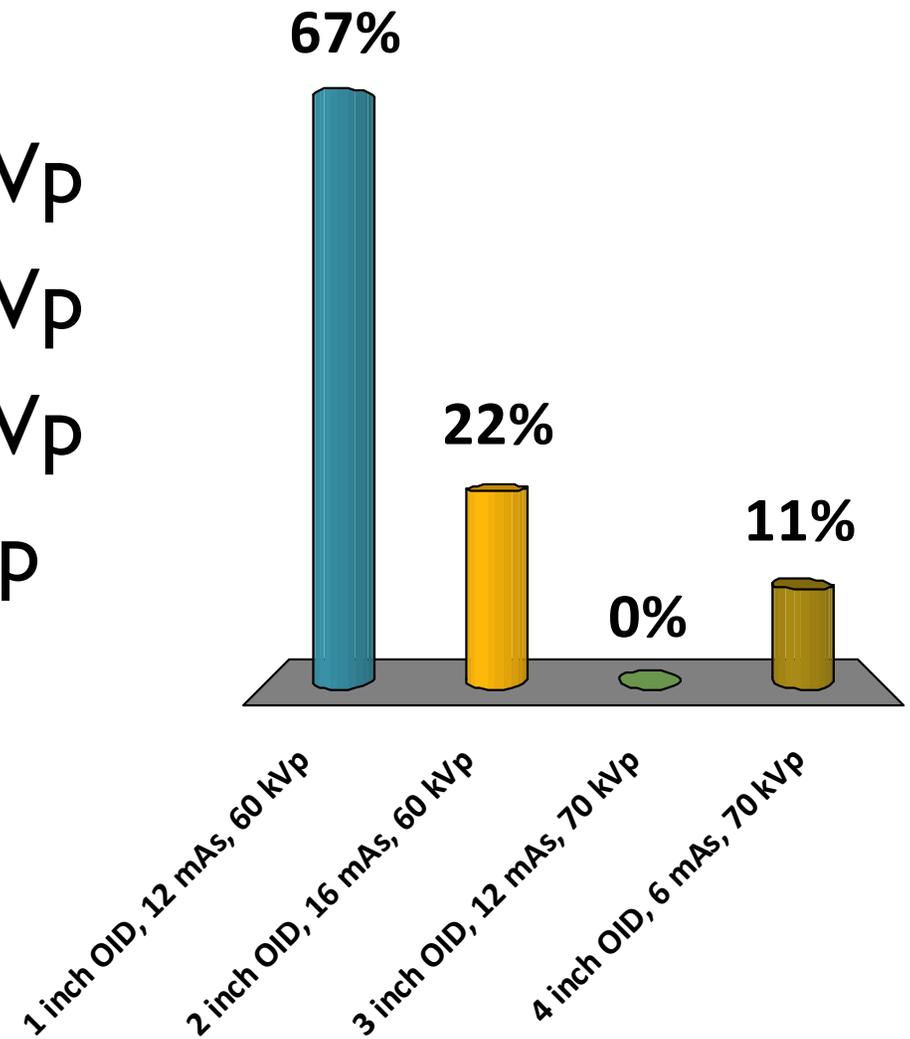

Which of the following would result in the least spatial resolution?

- A. 1 inch OID
- B. 2 inch OID
- C. 3 inch OID
- ★ D. 4 inch OID

Which of the following would result in the **best** spatial resolution?

- ★ A. 1 inch OID, 12 mAs, 60 kVp
- B. 2 inch OID, 16 mAs, 60 kVp
- C. 3 inch OID, 12 mAs, 70 kVp
- D. 4 inch OID, 6 mAs, 70 kVp

OID and Spatial Resolution

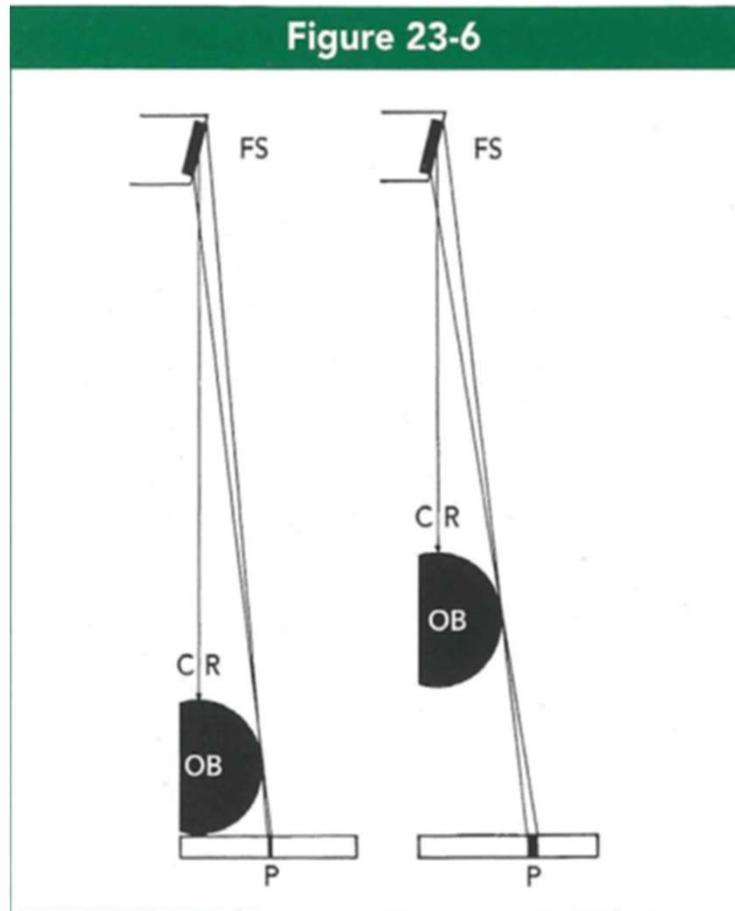

Diagram of the effect of increasing OID (right) on spreading the penumbra, thus reducing sharpness. (From Quinn B. Carroll, *Practical Radiographic Imaging*, 8th ed. Springfield, IL: Charles C Thomas, Publisher, Ltd., 2007. Reprinted by permission.)

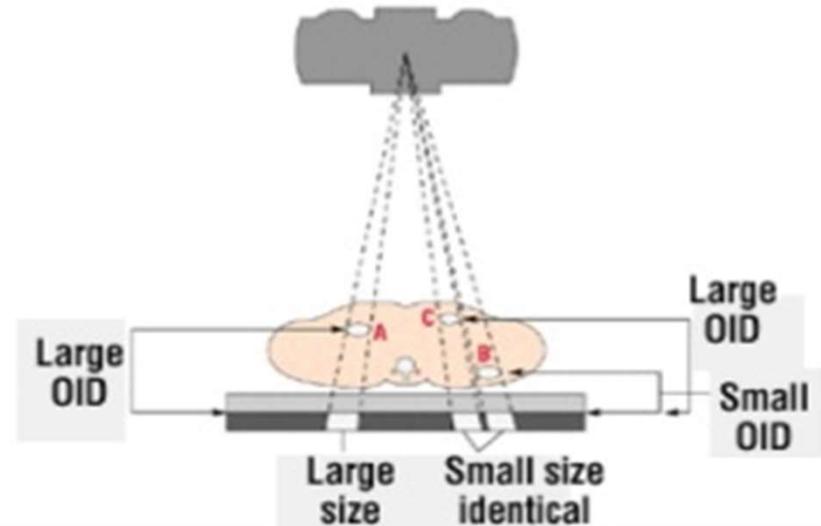

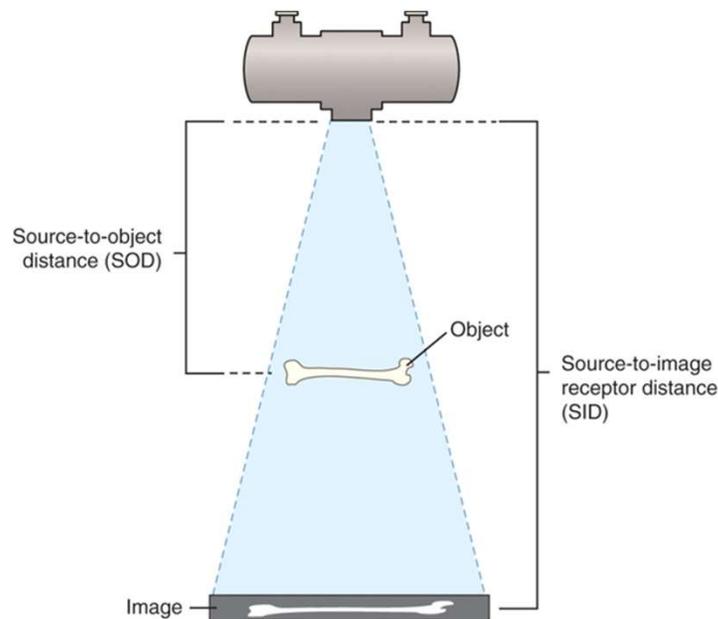

OID

- To Summarize:
 - Increased OID
 - Less receptor exposure (less scatter)
 - Improved radiographic contrast (less scatter)
 - Increased magnification (size distortion)
 - Decreased spatial resolution (greater unsharpness)

Magnification Factor

#5 - What does the magnification factor (MF) indicate and how is it expressed mathematically?

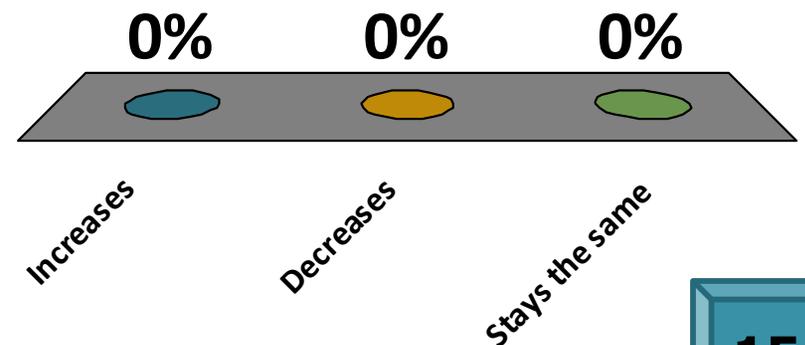

Even though objects A and B are identical, their projected images are different. Object C is smaller than B, but because C's OID is greater, their image sizes are identical.

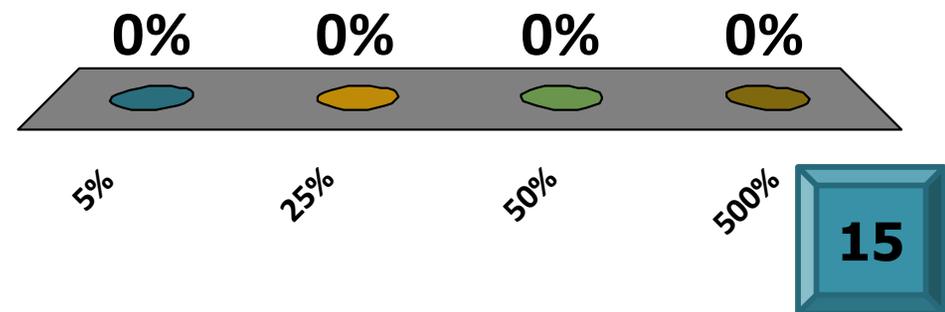

As magnification increases, what happens to spatial resolution?

- A. Increases
- ★ B. Decreases
- C. Stays the same

If an object has an MF equal to 1.5, what percentage of magnification is demonstrated on the image?

- A. 5%
- B. 25%
- ★ C. 50%
- D. 500%

True Object Size

#7 - What formula is used to calculate true object size?

**Complete #19 on worksheet*

Projected Image Size

#8 - How could you solve for image size if the object size and MF is known?

**Complete #20 - #22 on worksheet*

Object Percentage of Magnification

#9 - What formula is used to determine % of Magnification?

**Complete #23 - #24 on worksheet*

Decreasing Magnification

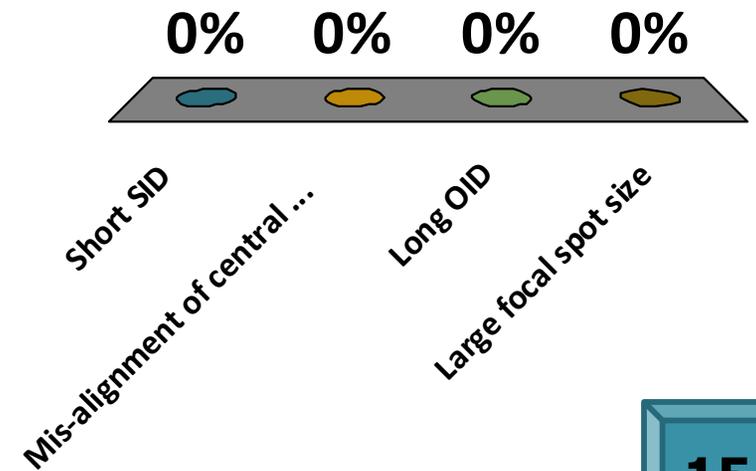

#10 - If a large OLD is unavoidable, what can be done to decrease magnification and increase resolution?

Angle – Tube/Part/Receptor

	Receptor Exposure	Spatial Resolution	Distortion
Focal Spot Size	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
SID	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/> Size
OID	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/> Size
Grid			
Tube filtration			
Beam restriction			
Motion			
Patient factors (size, pathology)			
Angle (tube, part, receptor)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Shape distortion is caused by:

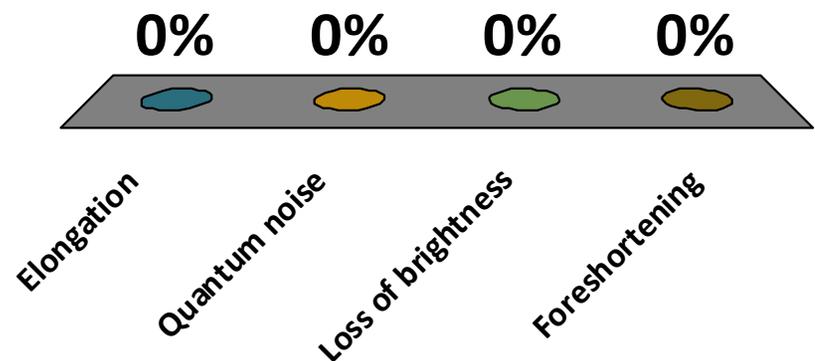

- A. Short SID
- B. Mis-alignment of central ray, part and/or IR
- C. Long OID
- D. Large focal spot size

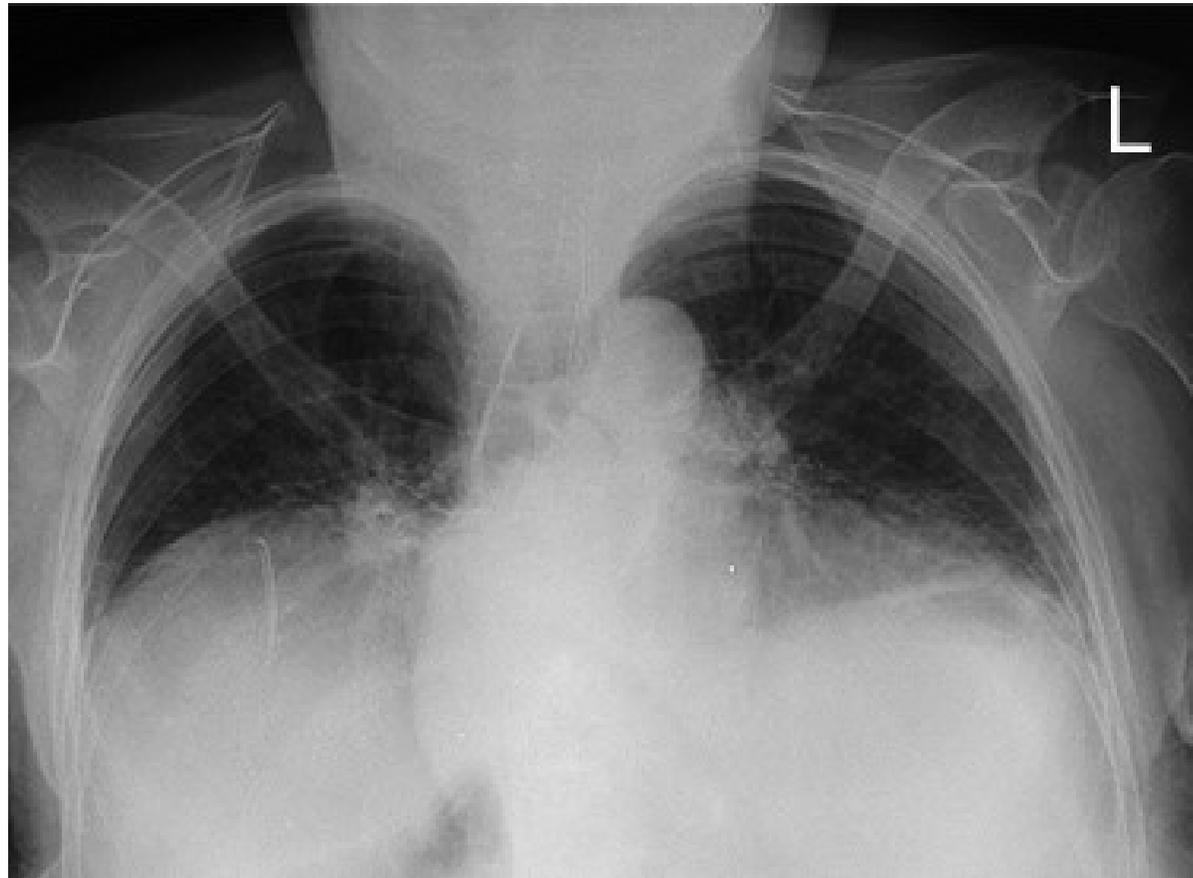

The picture below would result in:

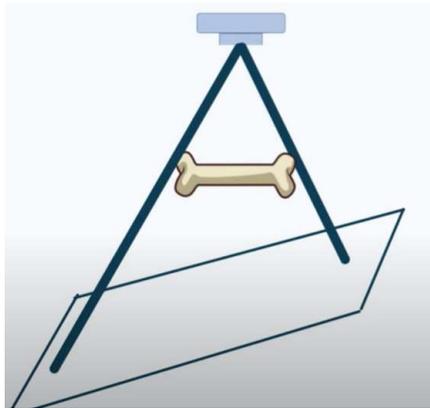

- A. Elongation
- B. Quantum noise
- C. Loss of brightness
- ★ D. Foreshortening

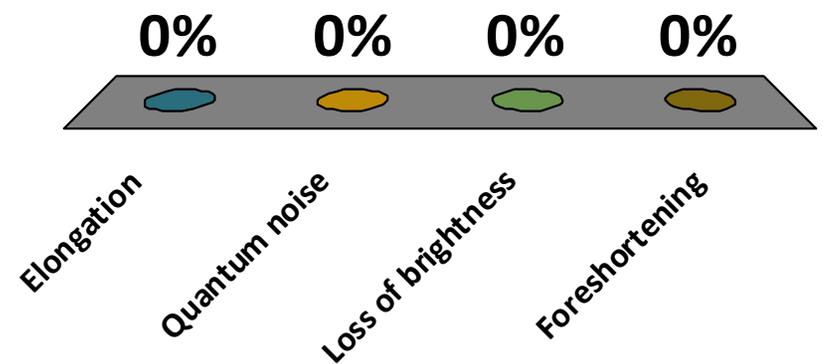

Foreshortening

The picture below would result in:

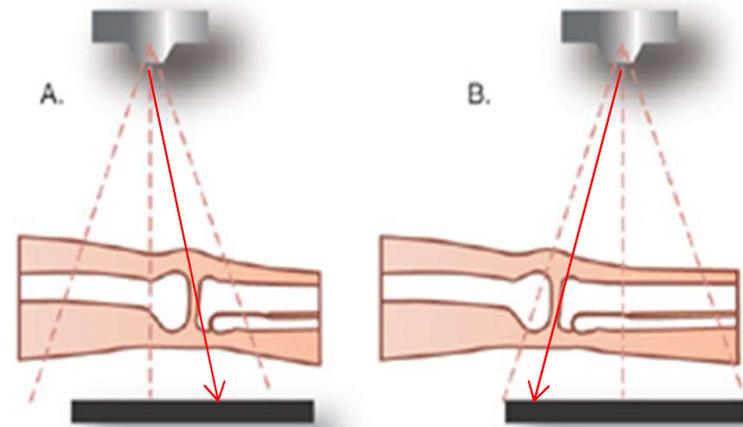

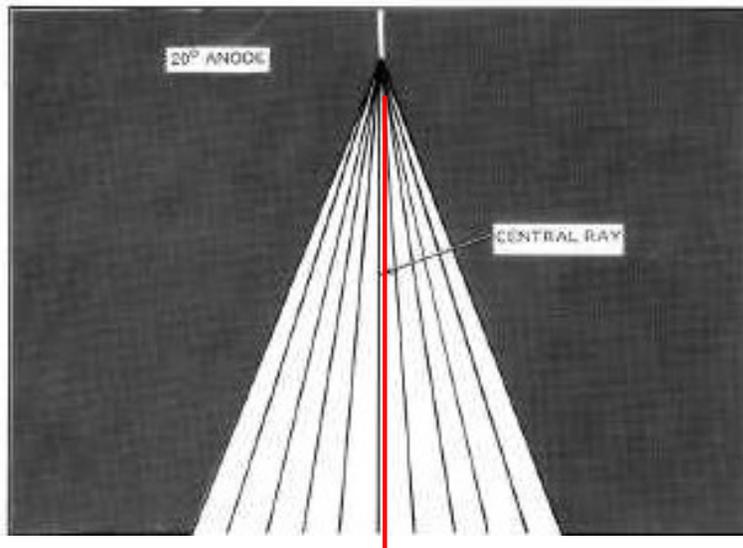

- ★ A. Elongation
- B. Quantum noise
- C. Loss of brightness
- D. Foreshortening

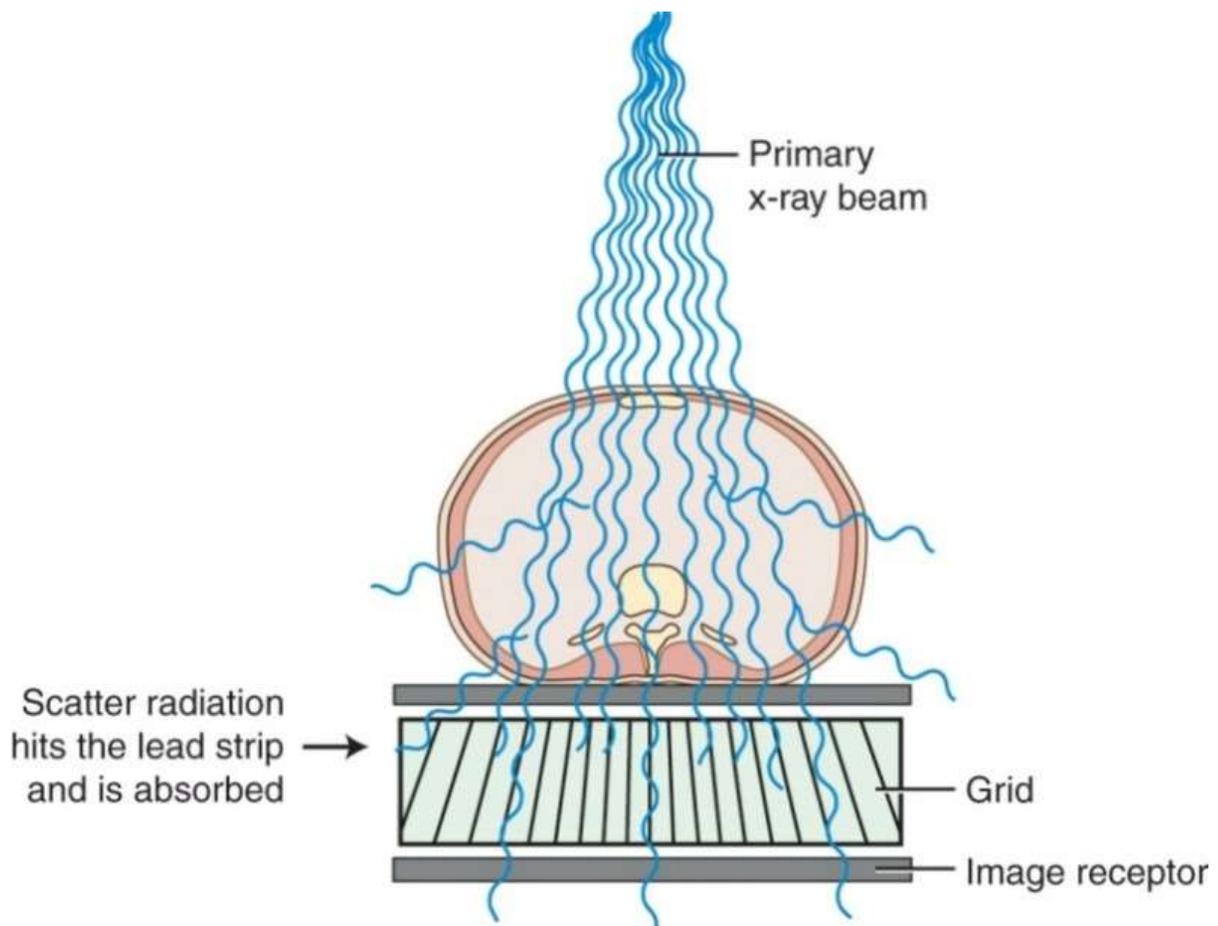

Central Ray and Distortion

- Off centering – diverging portion striking body part will cause distortion

Grids

	Receptor Exposure	Spatial Resolution	Distortion
Focal Spot Size	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
SID	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/> Size

Which of the following field sizes would result in the least receptor exposure?

- A. 8x10
- B. 10x12
- C. 11x14
- D. 14x17

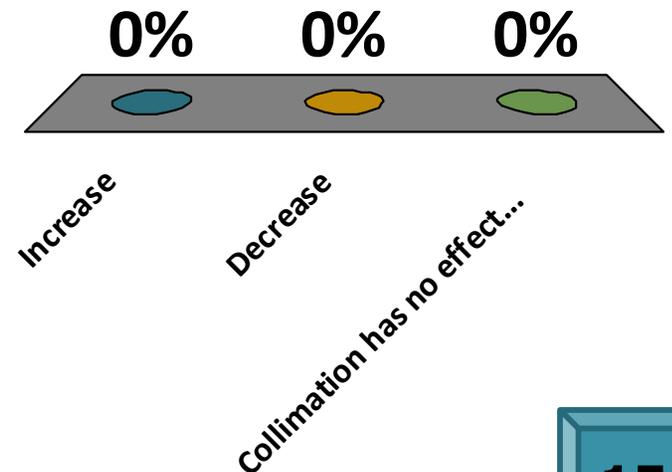

Which of the following field sizes would result in the highest patient dose?

- A. 8x10
- B. 10x12
- C. 11x14
-  D. 14x17

How will increasing collimation effect radiographic contrast?

- A. Increase
- B. Decrease
- C. Collimation has no effect on contrast

Beam Restriction Summary

- Larger field size (decreasing collimation)
 - Increases the amount of tissue irradiated,
 - More / less scatter produced?
 - Increase / decrease receptor exposure?
 - Increase / decrease patient dose?
 - Higher / Less radiographic contrast?

Beam Restriction Technique Adjustment

- Does a technologist need to do anything to accommodate for the loss of receptor exposure when increasing collimation?

Generator Output and Technique

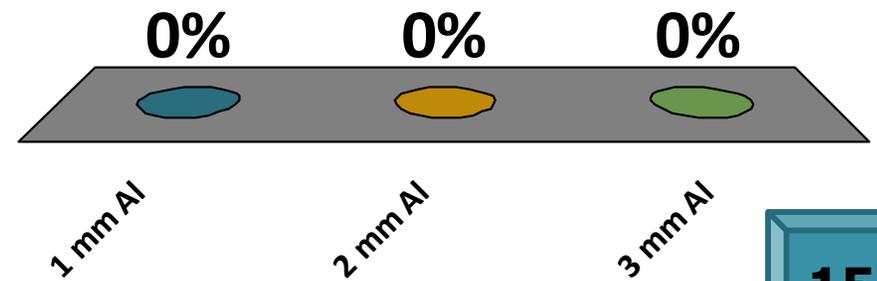

#13 - How do technical factors need to be adjusted if using a high frequency unit in comparison to a single phase unit?

Tube Filtration

	Receptor Exposure	Spatial Resolution	Distortion
Focal Spot Size	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
SID	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox" value="Size"/>

Motion			
Patient factors (size, pathology)			
Angle (tube, part, receptor)	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox" value="Shape"/>

Which of the following filtration amounts would result in the least receptor exposure?

- A. 1 mm Al
- B. 2 mm Al
-  C. 3 mm Al

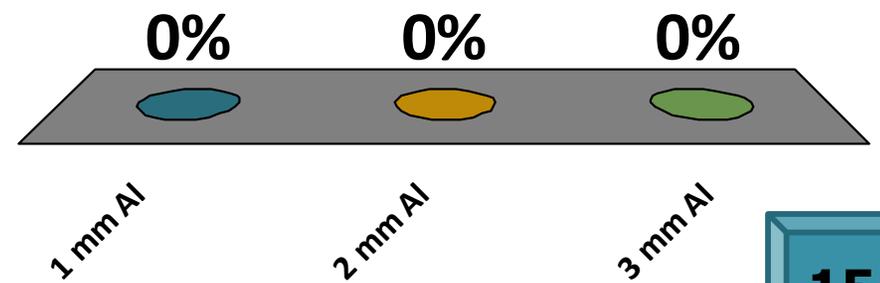

Which of the following filtration amounts would result in a longer scale of contrast?

A. 1 mm Al

B. 2 mm Al

C. 3 mm Al

Compensating Filters

#15 - How do technical factors need to be adjusted if using a compensating filter?
How does this affect patient dose?

Patient Factors

	Receptor Exposure	Spatial Resolution	Distortion
Focal Spot Size	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/>
SID	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/> Size
OID	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/> Size
Grid	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Tube filtration	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Beam restriction	<input checked="" type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Motion	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Patient factors (size, pathology)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Angle (tube, part, receptor)	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/> Shape

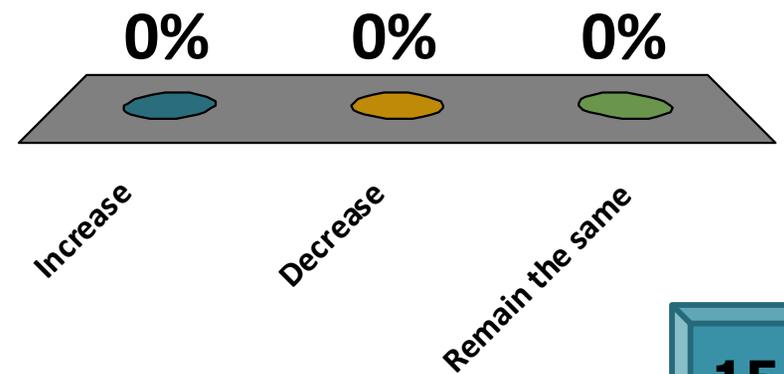

Body Habitus

#16 - Explain how technical factors need to be adjusted for hypersthenic and asthenic patients.

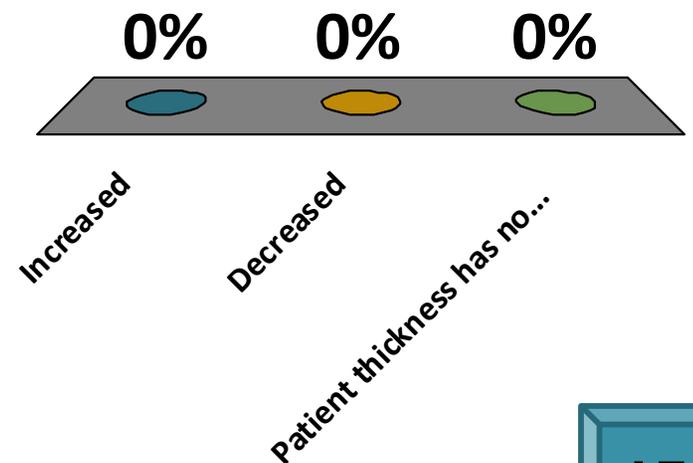

Increased patient thickness will cause receptor exposure to:

- A. Increase
- ★ B. Decrease
- C. Remain the same

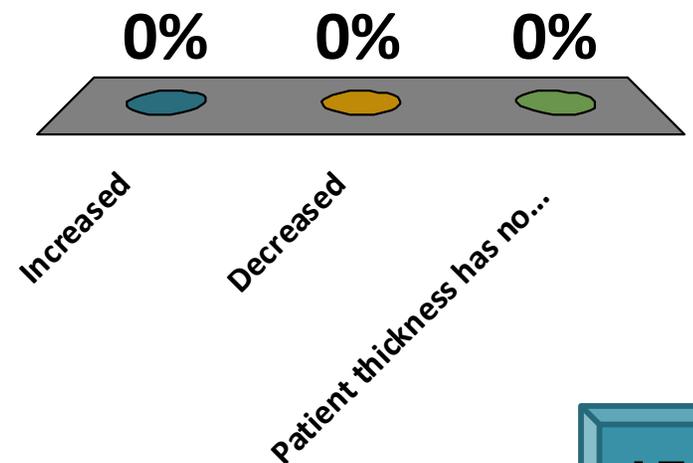

Increased patient thickness will lead to _____ scatter production.

- ★ A. Increased
- B. Decreased
- C. Patient thickness has no effect on scatter production

Increased patient thickness will lead to _____ radiographic contrast.

- A. Increased
- ★ B. Decreased
- C. Patient thickness has no effect on contrast

Motion

Motion	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Patient factors (size, pathology)	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/> Size
Angle (tube, part, receptor)	<input type="checkbox"/>	<input checked="" type="checkbox"/>	<input type="checkbox"/> Shape

Radiation Protection Review

#19 - Identify four ways a radiographer can reduce patient dose.

Using CR instead of DR requires the radiographer to:

- A. Double mAs
- B. $\frac{1}{2}$ mAs
- C. Increase kVp by 15%
- D. Decrease kVp by 15%
