

Psychology Test Chapter 1

1. Name and describe five of psychology's subfields:

Some subfields of psychology are cognitive, studying mental sensation and perception. Social, studying how people interact with each other. Educational, developing new teaching methods. Personality, studying people's unique personalities. And Psychological, studying the physical structure of the brain.

2. Identify and describe the four things psychologists do:

Psychologists do four things describes in the chapter: Identify triggers and factors that influence feelings and emotions. Observe psychological patterns and observations. Test theories related to those observations. Develop meaningful techniques to predict psychological behavior. All of these are put together to produce new revelations of how we can act to glorify God.

3. Identify and describe the five main approaches to psychology:

Five main approaches to psychology are biological, purely physical-based reasoning and study. Behavioral, how behaviors change with the environment. Psycho-analytic, unconscious processes operating. Humanistic, based on the inherent goodness of man. And cognitive, emphasizes phenomena like perception and thinking. Only some of these are to be used in a Christian form of study.

4. Neuroscientist definition:

The study of the brain, intercommunication of nerve cells, and brain genetics.
