

Elective 6: Diagnosing Student Misconceptions in Force and Motion

Melissa Roberts

Overview:

For this elective assignment, I designed a diagnostic test using questions from Diagnoser.com. I divided the diagnostic into five categories dealing with motion: Position and Distance; Change in Direction; Determining Speed; Change in Speed; and Average Speed. Each category had three to six multiple choice or short-answer questions to assess student understanding. I administered the diagnostic using GoFormative to one of my 8th grade physical science classes. A total of 17 students took the diagnostic. We do not study physics until the spring, so my students had no exposure to the content before the diagnostic. The diagnostic questions are attached as a Word document. On the file tabs you will find my students' raw data, a graphical representation by question/category, and classroom applications based on the results.

NOTE: If you have a GoFormative account, you can create a copy of the diagnostic using the link below
<https://goformative.com/clone/46XWY2>

Correct Answers Per Category

Diagnostic Category

Strengths & Weaknesses:

Based on the diagnostic results, my students do not have a solid understanding of motion. They performed best on the Change in Speed category of the diagnostic with an average of 13.3 students getting each question in the section correct, followed by the Determining Speed category with an average of 7.2 students getting each question in the section correct. The students scored best on questions 16, 17, 18, and 19. Only an average of 3.2 students answered each question correctly in the Average Speed category. This category is a weakness for my students.

Classroom Application & Remediation:

The diagnostic results make it clear that there is a limited understanding of motion. I will introduce my students to the Positions and Distance and Change in Direction concepts using "The Moving Man" Phet simulation. This simulation allows students to discover how motion is graphed on a time vs. position graph. I can also use the "Match That Graph" concept builder from The Physics Classroom for additional practice in determining the graphical representation of an object's motion. The Average Speed category was the greatest weakness. To help my students understand the concept of speed, I will complete activities in which we calculate their average speed of running, hopping, skipping, etc. down the hallway. To reinforce this topic, I could also use the "Dungeon Simulation" from CK-12, which challenges the students to solve for the speed that an object must travel to reach a particular destination, or the "Distance, Average Speed, and Time Virtual Lab" from Glencoe in which students investigate the distance an object moves based on its speed. To conclude, although students scored well in speed (Determining Speed and Change in Speed), they do not have a clear understanding of motion overall. I would be interested to see the results of a re-diagnostic after instruction on these topics, and then I would better be able to pinpoint misconceptions and remediate accordingly.
